Fluid transport in the Sherwood Sandstone: influences of diagenesis and lithofacies

Joanna Thompson*, Ed Hough, Oliver Wakefield, Cath Cripps
British Geological Survey, Nottingham, UK

* jbrayson@bgs.ac.uk

Introduction

- Lateral equivalent of hydrocarbon producing units
 - Major aquifer
 - CCS
-
- Needwood Basin
 - Thin sections
 - Diagenetic history

Needwood Basin

East Midlands Shelf

Sherwood Sandstone Group

Formerly Sherwood Sandstone Group

(Bourquin et al., 2011)

Adapted from Ambrose et al (2014)

Data collection and Methods

- 5 borehole cores, 30 polished thin sections
- Optical Microscopy
- SEM
- jPOR (Grove and Jerram 2011)

Diagenetic textures

- Compaction

200 μm

Diagenetic textures

- Compaction
- Cements, exploded grain texture

Diagenetic textures

- Compaction
- Cements, exploded grain texture
- Sedimentary structures

2000 μm

Diagenetic textures

- Compaction
- Cements, exploded grain texture
- Sedimentary structures
- Framework grain dissolution

500 μm

Diagenetic textures

- Compaction
- Cements, exploded grain texture
- Sedimentary structures
- Framework grain dissolution
- Calcrete and dolocrete

2000 μm

Diagenetic textures

- Compaction
- Cements, exploded grain texture
- Sedimentary structures
- Framework grain dissolution
- Calcrete and dolocrete
- Replacement minerals

Diagenetic textures

- Compaction
- Cements, exploded grain texture
- Sedimentary structures
- Framework grain dissolution
- Calcrete and dolocrete
- Replacement minerals

Baryte mineralisation

Cross
bedded
sandstone

Low-angle
cross
bedded
sandstone

Horizontal/
near-
horizontal
bedded
sandstone

Massive
sandstone

Pebbly
sandstone

Muddy
facies

Porosity

- Calcrete/dolocrete 17% less pore volume
- Iron oxide cement 8% less
- Baryte 23% less
- Calcite cement, no difference to porosity

Facies control on diagenesis

- Quartz overgrowths
- Framework grain dissolution
- Compaction
- Exploded grains/calcite cement
- Dolomite cement

	Eodiagenesis	Mesodiagenesis	Telodiagenesis	Porosity		
				Av.	Max.	Min.
Crossbedded SDST				29.92	40.10	6.58
Low-angle crossbedded SDST				25.32	41.35	4.50
Horz./near-horz. SDST				21.85	40.76	3.96
Massive SDST				37.29		
Pebbly SDST				8.00	17.47	1.73
Fines				3.59	12.98	0.11

Kaolinite
 Quartz overgrowth
 Framework grain dissolution
 Calcite cement (floating grains indicate 'exploded grain' texture)

Implications for fluid flow

- Small part of a bigger picture
- Fluid flow modelling
- Improve efficiency of extraction
- Reduce associated risk
- Aquifer management - pathways

Further work

- Energy Security and Innovation Observing System (ESIOS)
- Statistics
- Permeability

Thank you and any questions?
